Summary

CS undergraduate building production-grade machine learning systems. PyTorch models served as clean REST APIs with FastAPI, containerized with Docker, and shipped reliably. Focused on the full path from notebook to production.

Technical Skills

Languages: Python

ML / DL: PyTorch, scikit-learn, Transformers (HuggingFace), LSTM, GPT-style models

MLOps: MLflow, DVC, Docker, FastAPI

Data: NumPy, Pandas

Tools: Git, GitHub, Linux

Selected Projects

- **Email Spam Classifier.** End-to-end ML pipeline with MLflow experiment tracking and DVC data versioning. Modular components: ingestion, validation, transformation, training, evaluation.
- **Question Answering System (GPT).** Decoder-only GPT-style QA system. Tokenization, dataset prep, fine-tuning loop with checkpointing, and inference utilities for context-grounded answers.
- **Next Word Predictor (LSTM).** PyTorch LSTM language model with tokenization pipeline and a lightweight web UI for interactive predictions.
- **Visa Eligibility Predictor (AU).** Production-style ML pipeline with modular components, hyperparameter tuning, and an API-ready serving layer.
- **Wine Quality Prediction.** Reproducible regression pipeline with config-driven training, cross-validation, and artifact tracking.
- **Text Summarization.** Transformer-based abstractive summarization with HuggingFace, fine-tuning, and ROUGE-style evaluation.

Education

Pokhara University — Bachelor of Computer System and Information Technology

Pokhara College of Management — Bachelor in Computer System and Information Technology, IT

Focus Areas

Production ML APIs · Containerized deployments · ML fundamentals · Shipping over theorizing
